

Abstract of the Disclosure

A contact 4 for a PGA socket 1 is formed with a plate-like base portion 41, a pair of projecting portions 42a, 42b provided continuously at one end of the base portion 41 to extend in a direction substantially equal to the base portion, a turned portion 43 provided continuously at the other end of the base portion 41 to face the base portion 41, and a tail portion 44 provided continuously at the other end of the base portion 41 not to face the base portion 41. The turned portion 43 is provided with a contact portion 43a contacting a pin of a PGA package on a surface of the turned portion 43 not facing the base portion 41. This prevents flux from adhering on the contact portion 43a of the contact 4 when the contact 4 is soldered on a board.
